

Kielce University of Technology

**FACULTY OF MANAGEMENT AND COMPUTER MODELLING**

## **Field of study: Management and Production Engineering**

The interdisciplinary field of study *Management and Production Engineering* makes it possible to train a new type of specialists, who will be able to combine modern knowledge with engineering and managerial skills. A market economy requires a new category of workers capable of undertaking tasks that result from the transformation related to cost rationalization and production techniques. The emergence of small and medium-sized companies, industrial restructuring, and privatization of enterprises force engineers to function both as engineers and managers. Apart from expertise in a specific field of technology, they are expected to have skills in economics, management, accounting, finance, law, ecology, logistics, etc. Interdisciplinary engineering and managerial personnel are actively involved in creating business activities, taking into account the laws of economy in connection with modern technology in a constantly changing market.
